Iron-based superconductors (IBSs) are one of the promising candidates of future high-magnetic-field applications because of their high critical temperature,  $T_c$ , high critical current density,  $J_c$ , and high upper critical field,  $H_{c2}$ . Most of researches on IBS wires and tapes have been conducted using 122-type compounds ( $(\text{Ba},\text{K})\text{Fe}_2\text{As}_2$  or  $(\text{Sr},\text{K})\text{Fe}_2\text{As}_2$ ), and a practical level of  $J_c$  above  $100 \text{ kAcm}^{-2}$  has been achieved in these wires and tapes. On the other hand, other IBS compounds are still investigated as raw materials for superconducting wires and tapes, such as  $\text{SmFeAsO}_{1-y}$  and  $\text{CaKFe}_4\text{As}_4$ , whose  $J_c$  at 4.2 K in self-field are approximately 40 and  $90 \text{ kAcm}^{-2}$ , respectively. Here, we report the fabrication and characterizations of  $\text{KCa}_2\text{Fe}_4\text{As}_4\text{F}_2$  round wires for the first time. Polycrystalline  $\text{KCa}_2\text{Fe}_4\text{As}_4\text{F}_2$  powder was prepared by solid-state reaction and its  $T_c$  was evaluated from magnetization measurement as shown in figure (a). Superconducting wires were fabricated by powder-in-tube (PIT) method and hot-isostatic-press (HIP) technique. The self-field  $J_c$  of the  $\text{KCa}_2\text{Fe}_4\text{As}_4\text{F}_2$  HIP wire fabricated at  $740^\circ\text{C}$  under a high pressure of 9 MPa for 0.5h, exceeded  $10 \text{ kAcm}^{-2}$  as shown in figure (b). Details of the optimization of the round wire to achieve large  $J_c$  values and extensive characterizations of wires using X-ray diffraction and magneto-optical imaging will be presented.
